Problem 1

An example of proper IV data is

```
data <- data.frame("Z" = c(1,1,0,0), "D" = c(1,1,0,0), "Y" = c(1,1,0,0))
data
```

```
##   Z D Y
## 1 1 1 1
## 2 1 1 1
## 3 0 0 0
## 4 0 0 0
```

```
Q <- cbind(data$D * data$Y, data$D*(1 - data$Y), data$Y*(1-data$D), data$D+data$Y - data
mean(Q[1:2,1]) - mean(Q[3:4,1])
```

```
## [1] 1
```

```
mean(Q[1:2,2]) - mean(Q[3:4,2])
```

```
## [1] 0
```

```
mean(Q[1:2,3]) - mean(Q[3:4,3])
```

```
## [1] 0
```

```
mean(Q[1:2,4]) - mean(Q[3:4,4])
```

```
## [1] 1
```

An example of improper IV data is

```
data <- data.frame("Z" = c(1,1,0,0), "D" = c(1,1,1,0), "Y" = c(1,1,0,0))
data
```

```
##   Z D Y
## 1 1 1 1
## 2 1 1 1
## 3 0 1 0
## 4 0 0 0
```

```
Q <- cbind(data$D * data$Y, data$D*(1 - data$Y), data$Y*(1-data$D), data$D+data$Y - data
mean(Q[1:2,1]) - mean(Q[3:4,1])
```

```
## [1] 1
```

```
mean(Q[1:2,2]) - mean(Q[3:4,2])
```

```
## [1] -0.5
```

```
mean(Q[1:2,3]) - mean(Q[3:4,3])
```

```
## [1] 0
```

```
mean(Q[1:2,4]) - mean(Q[3:4,4])
```

```
## [1] 0.5
```

Problem 3

Some sketch about our data: there are many tricky properties in our data. For missing values, we interpolate the income and work length data as zero for those unemployed. This helps us avoid dropping so many NA values in our observations. The total observations dropped is 354 out of 10454 (already dropping those with no response).

```
xdat <- read.csv("X.csv", header = T, sep = ",")
ydat <- read.csv(file="Y.csv", header = TRUE, sep = ",")
dat <- bind_cols(xdat, ydat)
names(dat)

```

Problem 4

The threshold we chose here is 12 years, which is the number of years of education before college. Due to the fact that we are investigating a particular instrumental variable which is the distance to college. It seems unnatural to choose any threshold below that. We'll discuss about the stability of the estimation using 16/18 years as thresholds, implying the treatment effect of attending grad school.

```
card <- read.csv("card.csv")
Y <- card$lwage
Z <- card$nearc2
D <- ifelse(card$educ > 12, 1, 0)
```

```
est = IV_Wald(Z, D, Y)
estVar = IV_Wald_delta(Z, D, Y)
print(paste("The (Wald) point estimate of the treatment effect for logwage is ", est$CAC
```

```
## [1] "The (Wald) point estimate of the treatment effect for logwage is  1.834171316761
```

```
print(paste(" and the confidence interval is [", est$CACE - 1.96*estVar,",",est$CACE + 1
```

```
## [1] " and the confidence interval is [0.435784069917934,3.23255856360489]"
```

```
# That's significantly different from zero.
```

```
# With covariates (Note that we're somehow arbitrarily dropping all the observations w
